Exam : **AZ-802**

Title : Administering Windows Server (beta)

Version : DEMO

1.A Group Policy Object is linked at the domain level and applies settings to all users. A second GPO linked to a specific Organisational Unit (OU) applies conflicting settings for users in that OU.
Which GPO settings apply to users in the OU?
A. The OU-level GPO settings apply for the conflicting settings because OU GPOs have higher precedence than domain GPOs in a non-enforced scenario.
B. The domain-level GPO settings always win because they are applied first and have higher precedence.
C. The settings are applied randomly depending on the order Group Policy processes the GPOs.
D. Both GPOs merge and the most restrictive settings from each are applied.
Answer: A

2.Windows Defender Application Control (WDAC) restricts which applications can execute on a Windows Server.
Which enforcement mode runs application control checks but does not block applications, allowing administrators to identify issues before enforcement?
A. Audit mode which logs blocked applications in the event log without preventing their execution.
B. Passive mode which requires manual administrator confirmation before blocking each application.
C. Monitor mode which uses Windows Defender AV scanning to flag unapproved applications.
D. Block mode which actively prevents all unapproved applications from running immediately.
Answer: A

3.Windows Server Migration Tools (WSMT) assist in migrating roles and features from older servers to newer versions.
Which migration scenario is supported by WSMT?
A. Migrating an on-premises physical server to an Azure VM using agentless replication.
B. Migrating a Windows Server role such as DHCP or File Services along with its configuration and data from a source server to a destination server.
C. Migrating a virtual machine between two Hyper-V hosts in a live migration operation.
D. Migrating Active Directory from Windows Server 2016 to Windows Server 2025 by upgrading the domain functional level.
Answer: B

4.Windows Server 2025 introduces SMB over QUIC as a file sharing transport.
What security advantage does this provide compared to traditional SMB over TCP?
A. It replaces SMB encryption entirely, eliminating the need for SMB signing and sealing.
B. It allows SMB file access over the internet or untrusted networks without requiring a VPN by using TLS 1.3 encryption natively in the QUIC transport layer.
C. It increases SMB throughput by using UDP instead of TCP and removing encryption overhead.
D. It restricts SMB access to clients running Windows 11 and Windows Server 2025 only.
Answer: B

5.Storage Spaces Direct (S2D) creates hyperconverged or disaggregated storage clusters using locally attached drives.
Which resiliency type provides tolerance for two simultaneous drive failures?

A. Simple (no resiliency) which striped data across drives without any fault tolerance.
B. Three-way mirror which maintains three copies of data and can tolerate two simultaneous drive or server failures.
C. Two-way mirror which maintains two copies of data tolerating only one drive failure at a time.
D. Parity space which provides better capacity efficiency than mirror but only tolerates one failure in a standard parity tier.
Answer: B
